Dear Hiring Manager

I'm a Senior Frontend / Full-Stack Engineer with over four years of experience building and operating production-grade SaaS and fintech systems for international, remote teams. I'm an EU citizen, fully eligible to work across the EU and open to remote or hybrid roles. My background is primarily in Angular and TypeScript, with strong end-to-end ownership across frontend architecture, backend services, and security-sensitive workflows.

In my most recent role, I owned the frontend and backend for a production financial dashboard used to manage API keys and wallet addresses, back up and export trade data, and provide analytics for day-to-day decision-making. The work involved secure credential handling via cloud secret management, integrating multiple third-party APIs, implementing role-based access control, and building operational tooling such as alerts, monitoring, and reporting. These systems handled real users, real data, and real operational risk, which shaped a strong focus on correctness, security, and maintainability.

Beyond core product work, I've contributed across multiple parallel initiatives, including frontend platform development, internal tooling, automation, and operational bots. I'm comfortable collaborating closely with designers, product owners, and backend engineers, and I'm used to taking features from initial discussion through to production support.

I value clear communication, ownership, and steady execution, especially in fast-moving remote environments. I'm eager to contribute to a team that cares about building reliable systems, making thoughtful technical trade-offs, and continuously improving how software is delivered.

I'd welcome the opportunity to discuss how my experience could be useful to your team.

sincerely.

William Barents
